

Process Mapping for Solution Design

Melissa Shepard CTA
CTO & Chief Architect @ Maple Digital
Twitter: @lissa__x

Project Benefits

- More collaboration between Business Analysts & Architects/Technical Team
- Help alleviate disconnect between functional & technical designs
- Improve team performance
- Make sure solutions meet requirements & expectations
- Eliminate gaps and major rework
- Help identify flaws in the process and where improvements should be made
- Reduce costs, higher ROI and faster time to market
- Make understanding and communicating the process much easier among teams, stakeholders, or customers

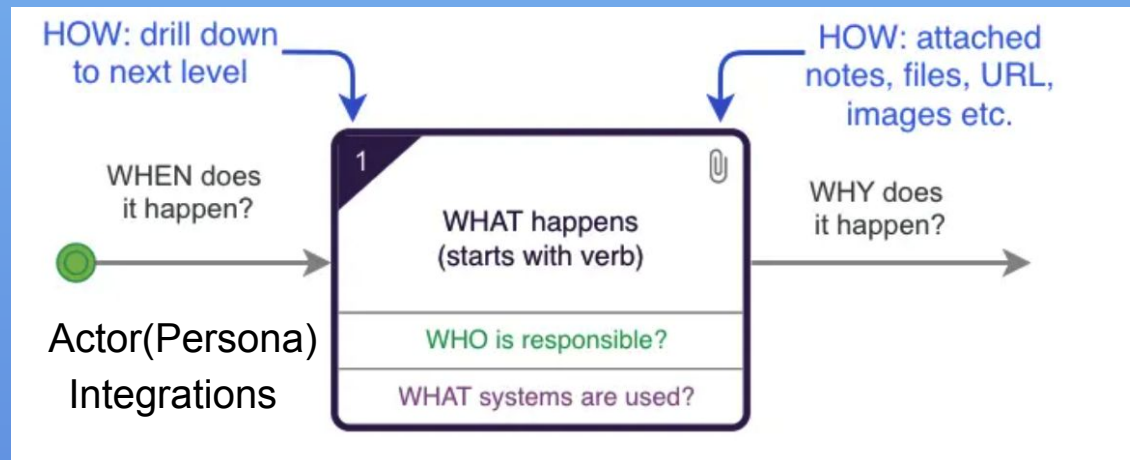

Results of Process Mapping

- ❖ Process Mapping can be used to understand the flow of data and the actions the users will take
- ❖ Process mapping creates visual representations of business processes
- ❖ Helps you define a holistic end-to-end solution
- ❖ Helps streamline processes and align business units
- ❖ Helps you connect the dots and address the gaps
- ❖ It will inform of what objects are necessary to hold data
 - Illustrates object relationships
- ❖ Any record ownership changes will be apparent
- ❖ Conversions will become obvious (eg Leads->Opportunities)
- ❖ Identify the high-touchpoint objects to inform data volumes
- ❖ Integration touchpoints will be apparent
- ❖ All systems involved will be clear

UPN

UPN Diagrams encapsulate every level of a process, from a top-level overview down to detailed, actionable diagrams

- ★ **Activity box:** A verb phrase labels each activity box.
- ★ **Resource:** the who tagged with RACI (responsible, accountable, consulted, and informed).
- ★ **Line with text:** Connect every activity box to another box and represent the handoff between steps
- ★ **Attachment:** Attachments provide documents, metadata, or metrics in the context of the process
- ★ **Decision:** lines coming from an activity box with text
- ★ **Drill down:** Any activity box can drill down to a lower-level diagram (8-10 levels)

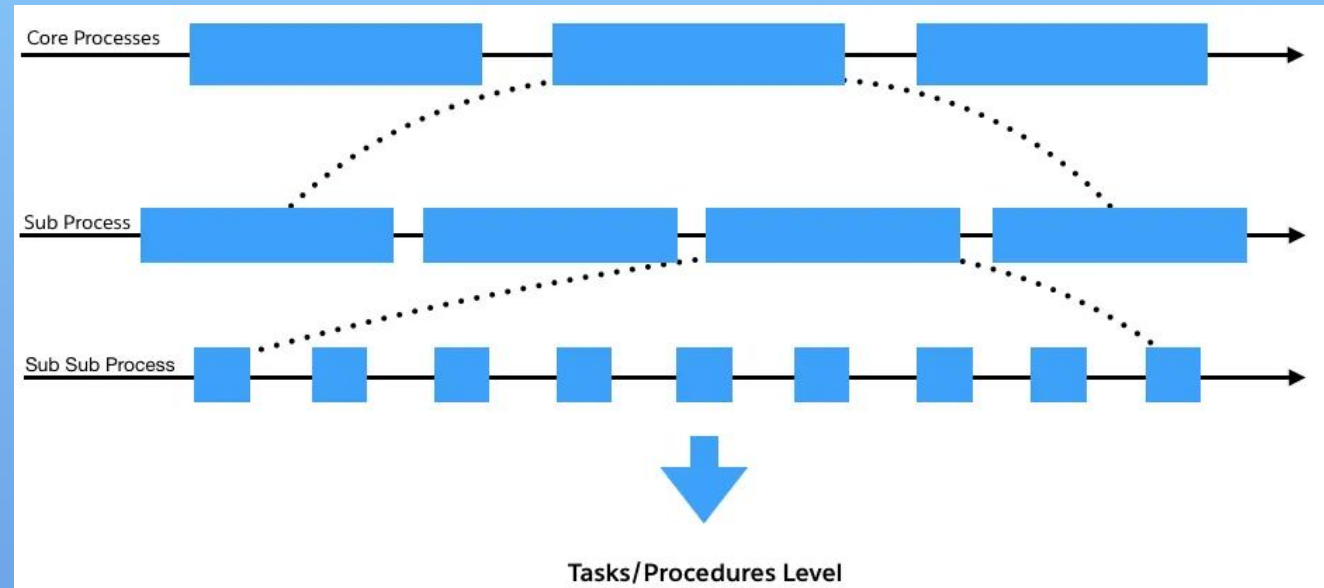

Activity

- Defines what a business does
- Who is responsible for what
- How standard business processes are completed
- How success is measured

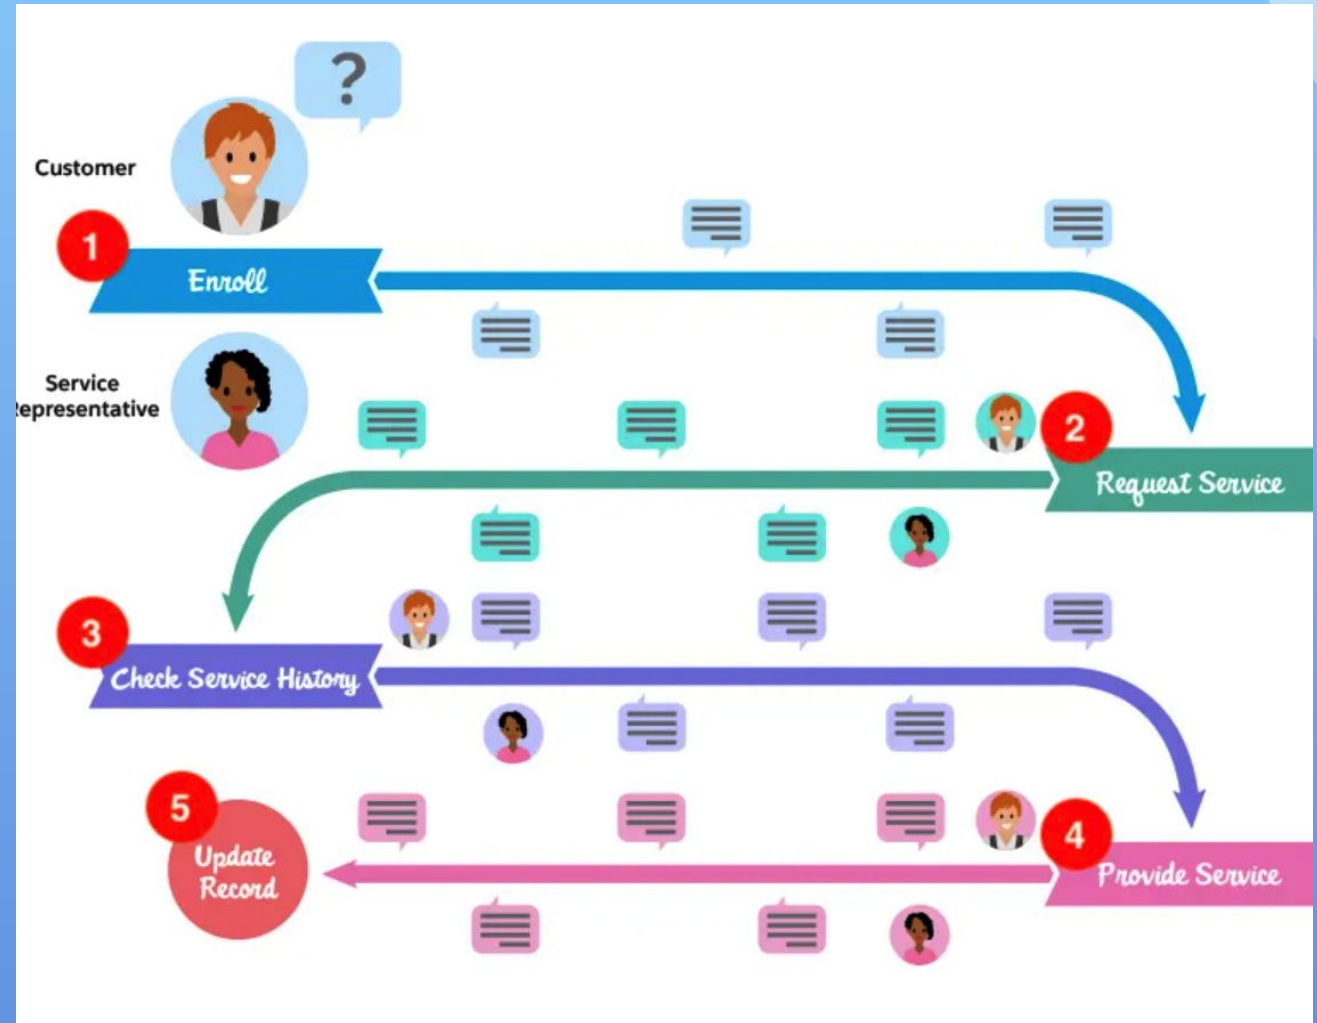

Main purpose is to show the relationship between the steps and the inputs of a business to establish a **clear, consistent,** and **concise** result

Compares a specific objective to the organization's overall objectives to make sure their processes are aligned with the company's values and capabilities

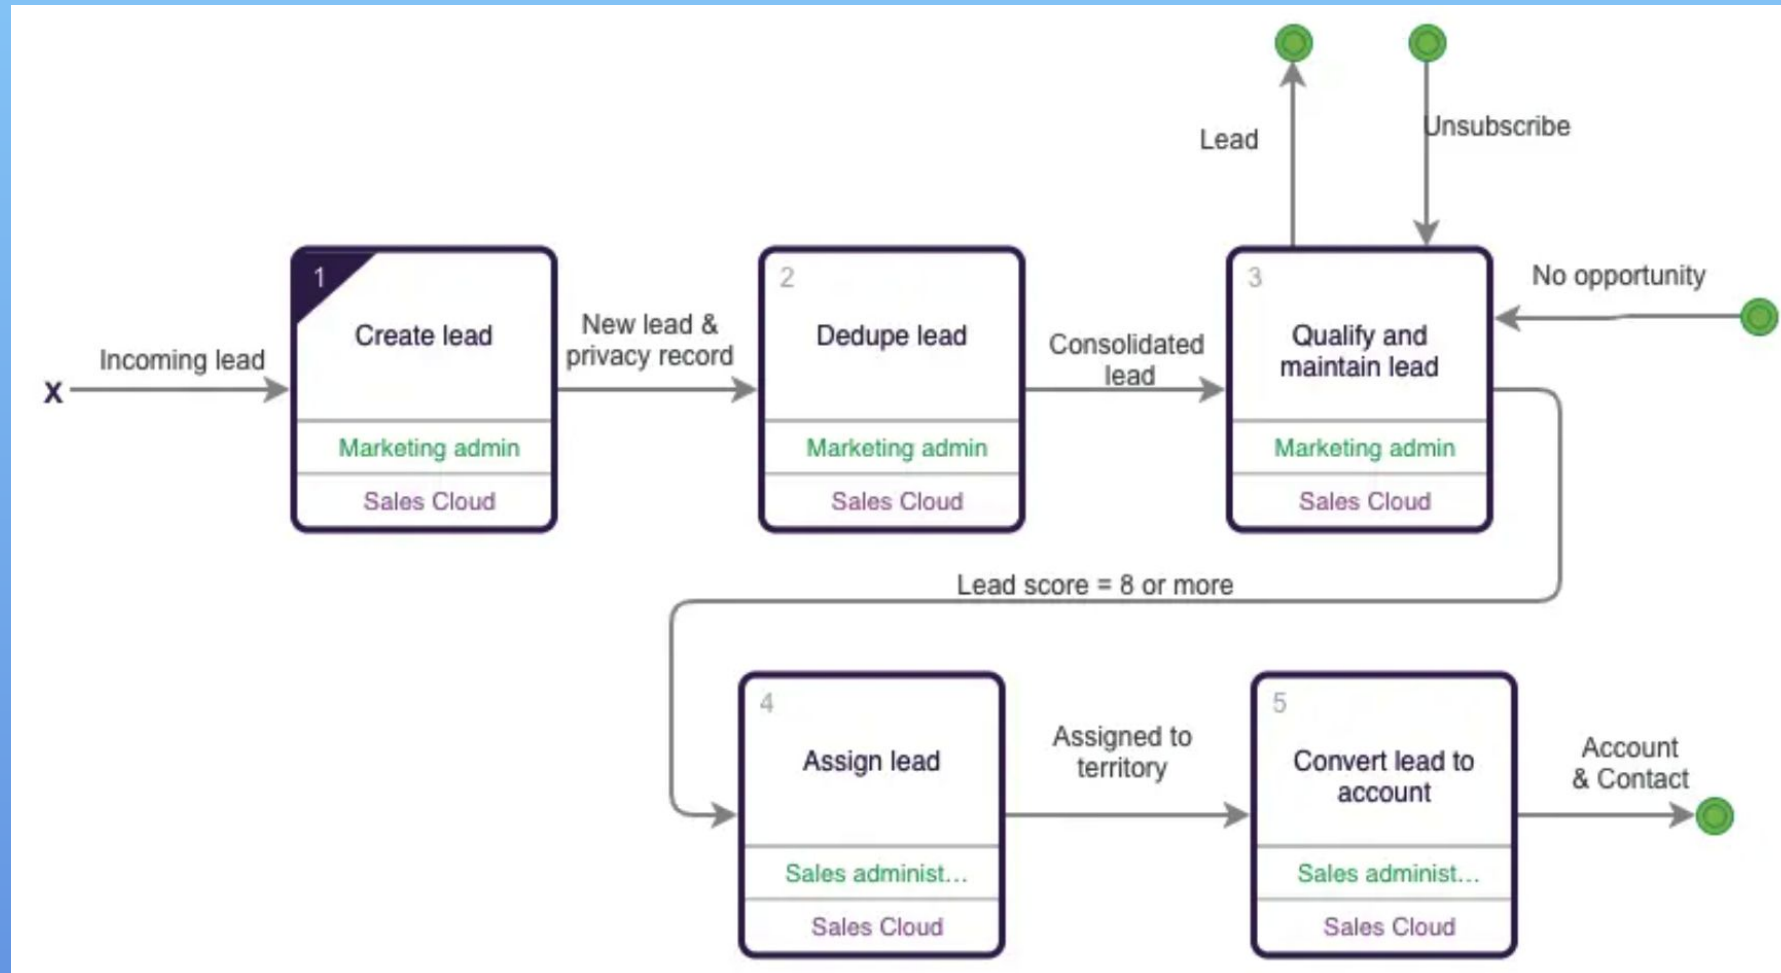

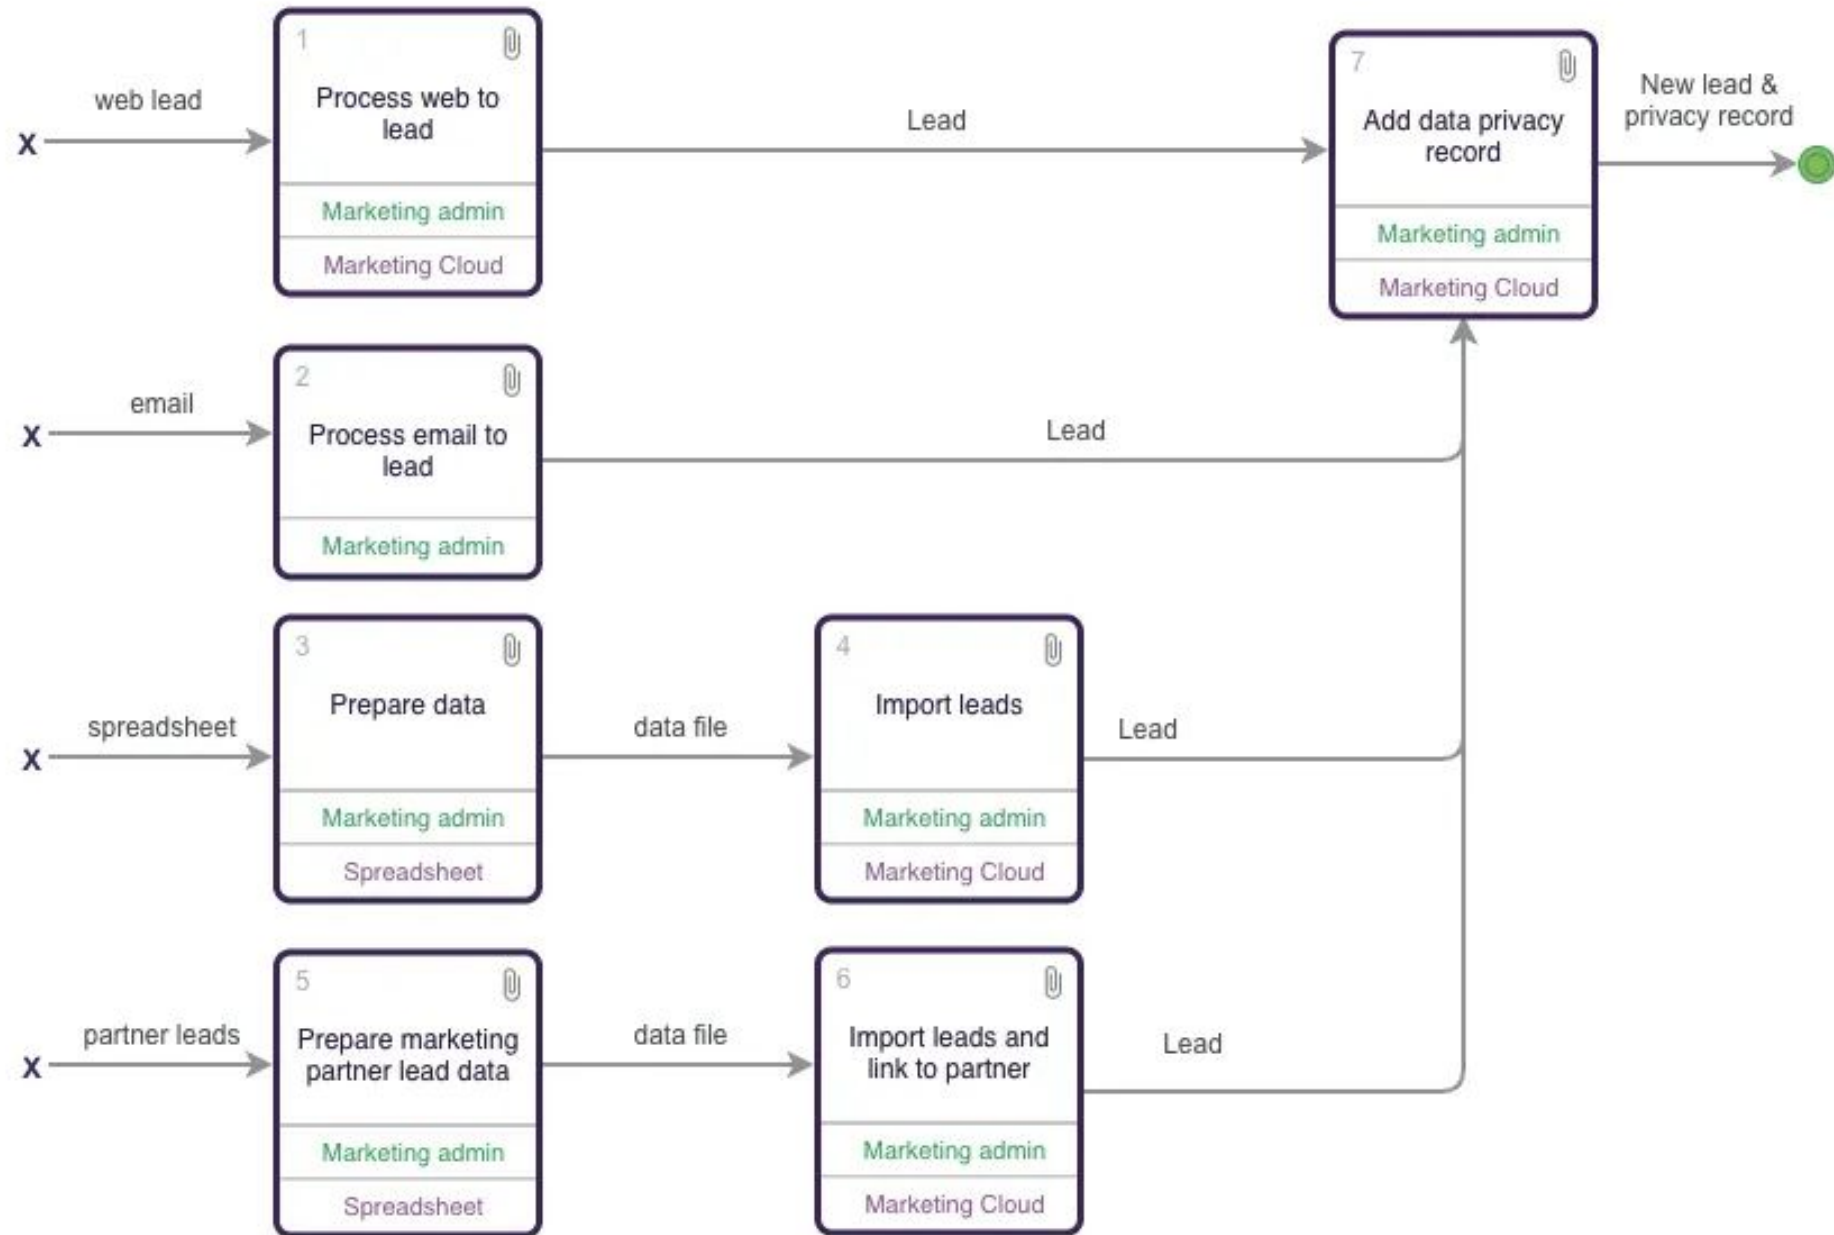

Journey Mapping

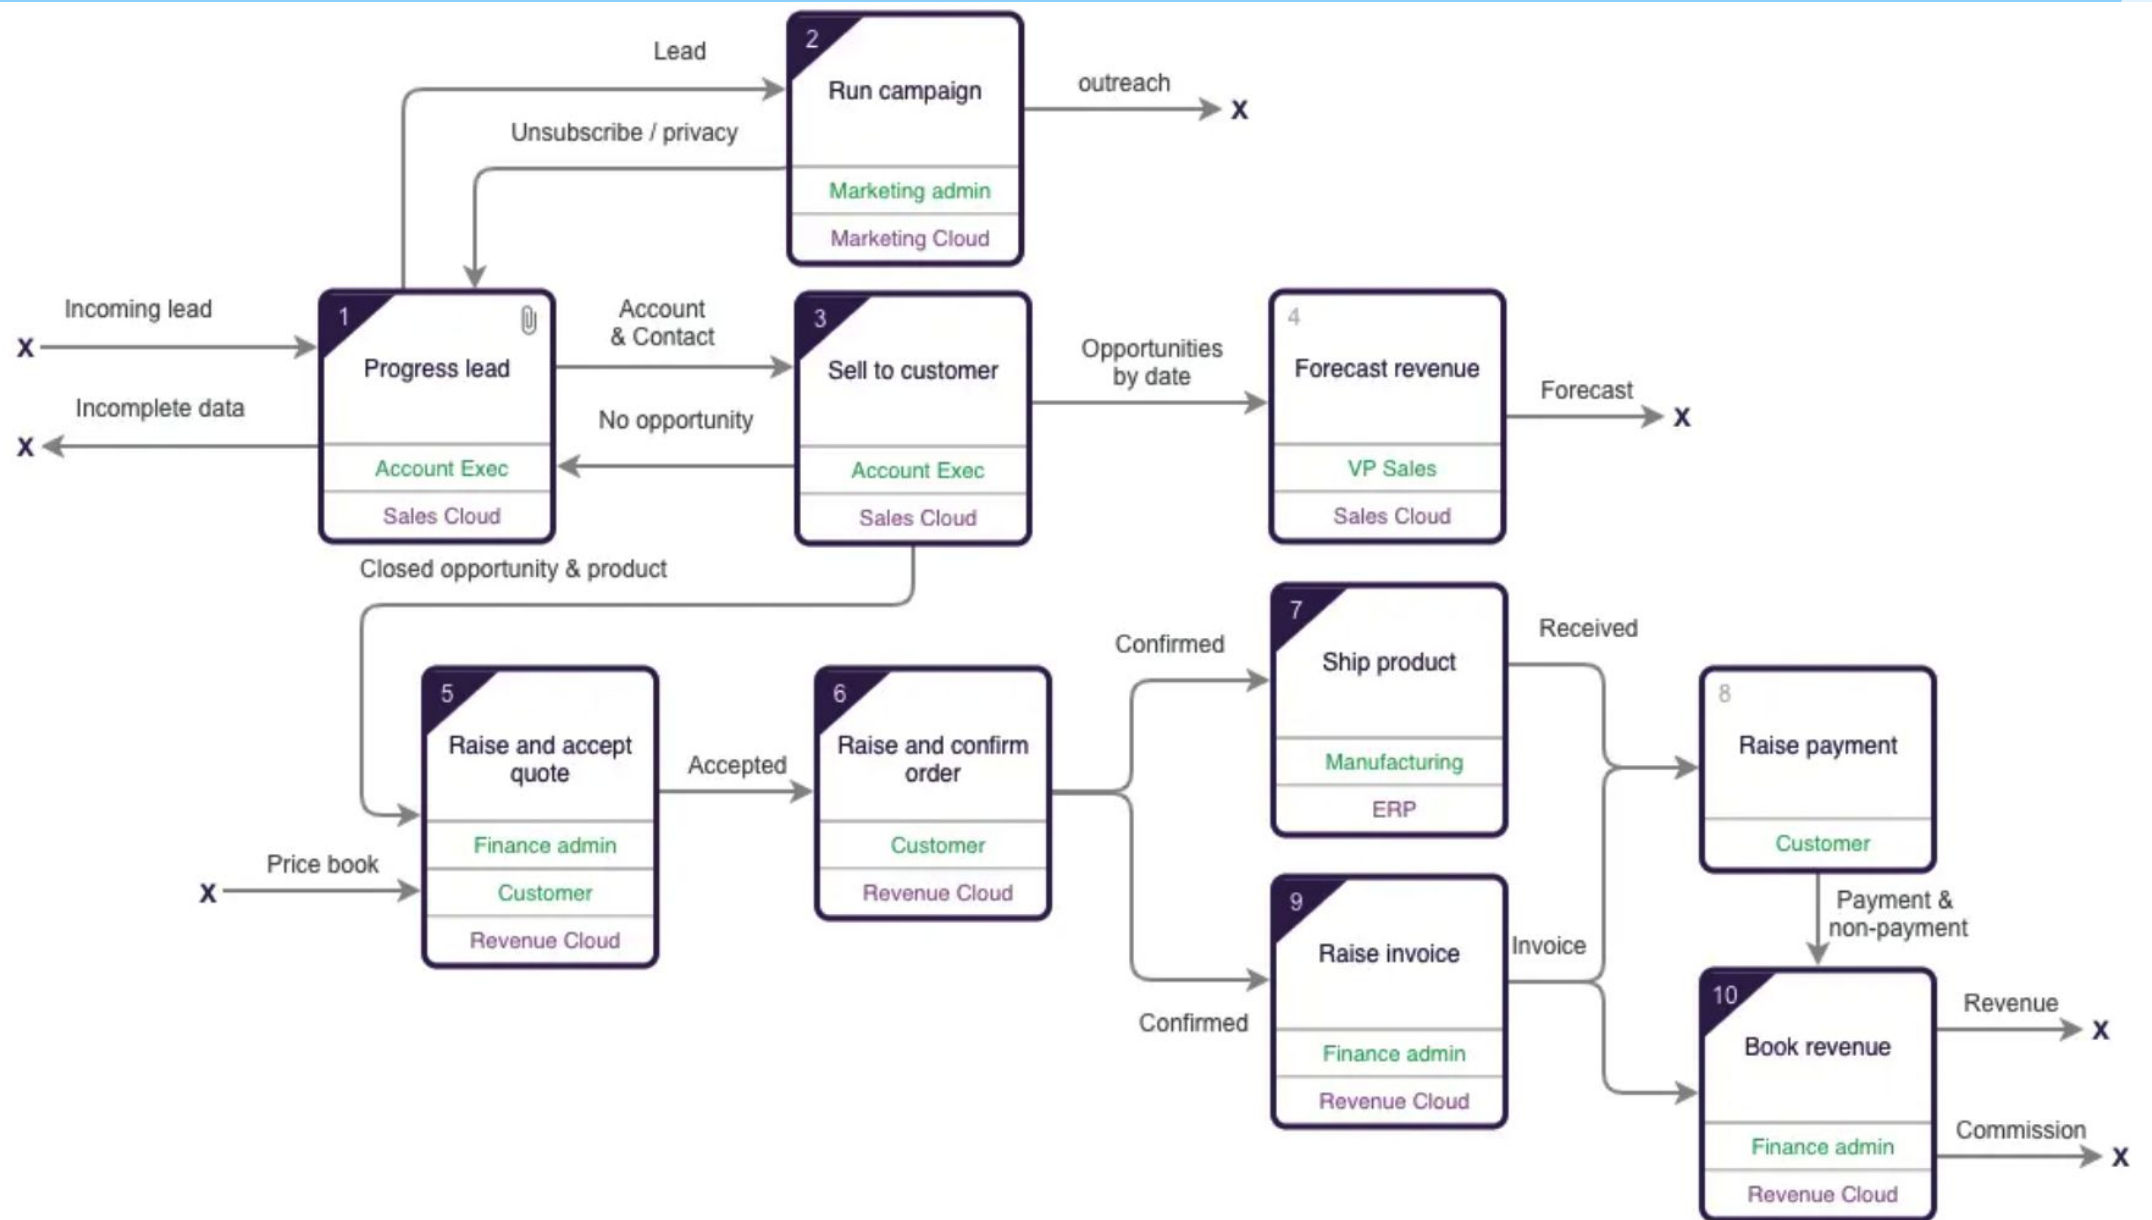

- Improve your solution design by mapping how customers experience your product or service
- This will help you understand what is going on with your customer and what it is you need to solve for them
- In the end, your journey map tells a story

Example Process

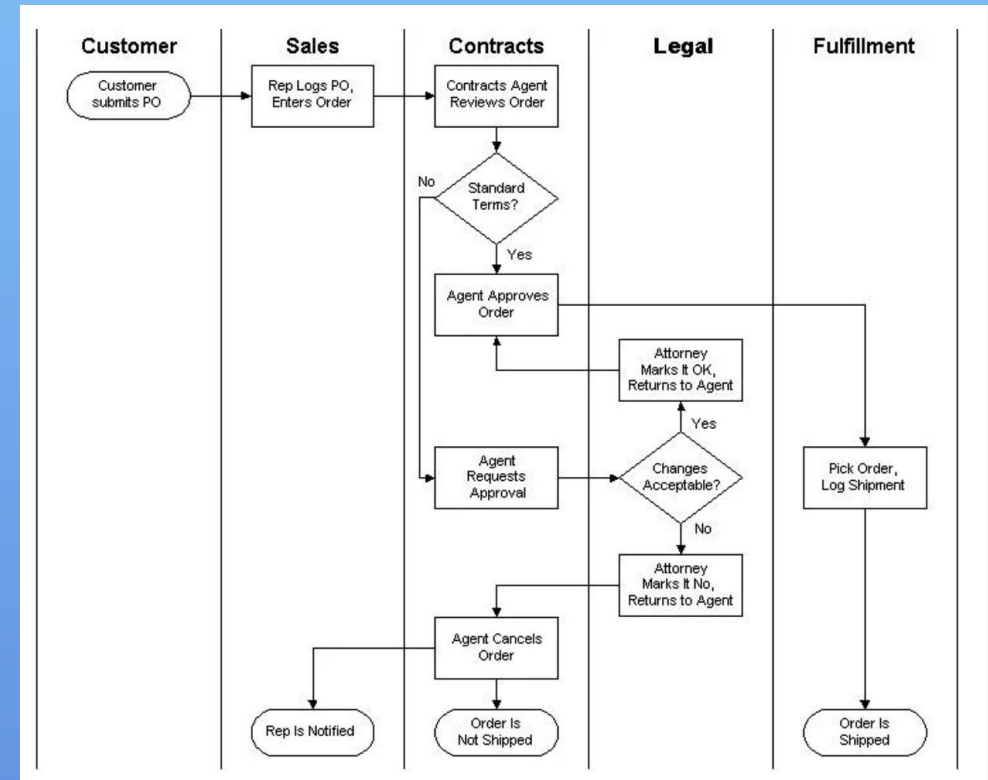

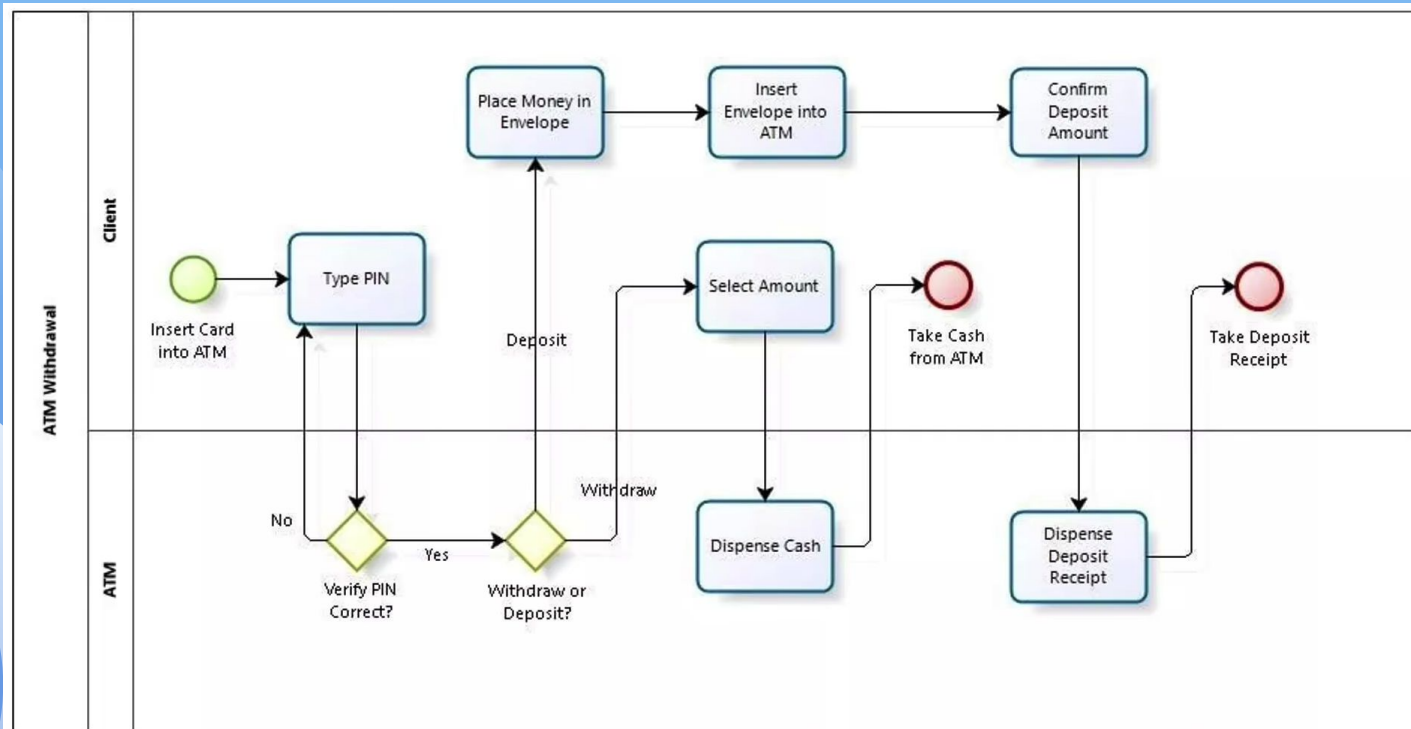

Flow Charts

- ❑ Similar to Process Maps but do not use UPN
- ❑ Used to tell the story and show the flow of data
- ❑ Shows the customer journey

Creating Process Maps

As you create your process maps think about trying to answer these questions as you go through business process:

- ❖ Who are the Actors/Personas involved in a process?
- ❖ What are the users doing?
- ❖ Why are they doing it?
- ❖ How/where are they doing it?
- ❖ What systems/integrations are involved?
 - Explain the data flow/pattern

Best Practices

Best practices for you to consider when creating a process map

- ★ Apply business process mapping to the right types of processes
- ★ Be clear about the focus/scope of your process mapping
- ★ Get someone skilled to map your processes
- ★ Validate your maps
- ★ Don't fix your processes until they are fully mapped
- ★ Build the right team
- ★ Keep it simple
- ★ Work with your stakeholders

LET'S PRACTICE!

SCENARIO PART 1

1. Prospective customers (+- 5,000 / month) can enter a form on the public website where they can upload some pictures or ground plans of their site.
2. The support representative pre-qualifies the prospective customer in Salesforce using a custom questionnaire, after which the support representative schedules a site visit for a system specialist.
3. During the site visit, the system specialist can do the following, all from within the same mobile application:
 - a. Take pictures and/or videos of the site and upload them for reference during final design. The photos and/or videos should be accessible from Salesforce.
 - b. Create a preliminary estimate and send a copy to the customer via email.
4. Back at the office, the system specialist creates design documents. Next they notify the customer to review the design and digitally sign an updated estimate to proceed with installation. If the customer disagrees with the design, they can add more information and upload more files to demonstrate possible misunderstandings from the system specialist.

LET'S PRACTICE!

SCENARIO PART 2

1. The system specialist selects a contractor for the customer installation who gets access to the designs, estimates and files via native credentials or Google credentials, reviews and approves them.
2. The order is created in Salesforce, and sent to the appropriate ERP system, where a sales order is created and fulfilled. Detailed order data in the ERP systems should be viewable or accessible from within Salesforce.
3. The ERP system updates the order status in Salesforce through the point of arrival at the customer location.
4. Once the order arrives at the customer location, the system specialist and contractor should be notified email that they can contact the customer and begin installation.
5. During installation, as each device is added to the customer installation, it is connected online to the monitoring system. UST would like this process to automatically create a record in Salesforce for the device, associated with the customer location.
6. Once installation is final, Salesforce is updated by the system specialist, and final information from the installation is sent to the ERP system for the creation of an invoice.

Key Takeaways

- As you practice Process Mapping you train your mind to see requirements from the User's perspective
- This is what helps you “tell the story”
- It will ensure that solutions are holistic and make sense for the intended users
- It will help to communicate requirements for technical solutions
- Eventually you will think and talk this way and won't have to keep doing it - it becomes “automatic” as you build the muscle memory
